

CS731 Project Group 4 - MVP

Having an additional member in our group provided us with more resources than the traditional group was intended to have. This came along with the responsibility of going the extra mile.

The approach we went for with respect to utilizing our additional resources was to work on developing the interface to a higher quality than would have been possible with fewer resources and also adding some other features to better improve the usability of the platform. We also paid attention to the code quality of our codebase, ensuring that making future changes or references to the codebase would not be tedious.

Below is a list of the additional features we were able to successfully complete and implement in our MVP:

1. Input validation across all forms on the interface
2. Edit Course (Instructor)
3. Edit Course Content (Instructor)
4. Profile (Instructor & Student)
5. Search for students when registering students (Instructor)
6. Unregister students (Instructor)
7. Forgot Password (Instructor & Student)
8. Enhanced usability for Registering Students based on feedback from presentation (Instructor)
9. Responsive interface for mobile
